## Critical Learning
- Water is fundamental to our way of life and also to the ecosystems upon which our lives depend.
- For this reason, we all have to take responsibility for maintaining our water supply.

### Guiding Questions
- What is our personal responsibility related to water?
- Do our personal conservation efforts match our use of water? Should they?
- How can scientists ensure that data collection is reliable?

## Curriculum Expectations

### Relating Science and Technology to Society and the Environment
1. Assess the impact of human activities and technologies on the sustainability of water resources.
   - **1.1** evaluate personal water consumption, compare it with personal water consumption in other countries, and propose a plan of action to reduce personal water consumption to help address water sustainability issues

### Developing Investigation and Communication Skills
2. Investigate factors that affect local water quality
   - **2.6** use appropriate science and technology vocabulary, including water table, aquifer, potable, and freshwater, in oral and written communication
   - **2.7** use a variety of forms (e.g. oral, written, graphic, multimedia) to communicate with different audiences for a variety of purposes

### Learning Goals
Students will be able to:
- evaluate their personal daily water consumption
- identify countries that have similar and different water consumption
- complete a plan to reduce personal water consumption
- use scientific and technological terminology in oral and written work

## Instructional Components and Context

### Readiness
- Basic map and atlas skills
- Reflective response

### Terminology
- Verify (test truth or accuracy of something)
- Audit (examine and verify)
- Reliable (accurate)

### Materials
- **Personal Water Audit** handout
- A short video about water conservation
- Water Portfolio
### Water Audit Lesson 2

#### Minds On (Elicit and Engage)

**Whole Class ➔ Using Terminology**

Use Share One-Get One with words introduced and included in the word wall in Lesson 1.

**Whole Class ➔ Establishing Purpose**

Brainstorm ways that students and/or their family use water in a typical day, e.g., showering, watering the lawn, doing dishes, laundry. Students (1) estimate how much water they think their family uses in a day, and (2) brainstorm how they might go about verifying the accuracy of their estimate.

Introduce the water audit activity. Explain that the timeline, e.g., Friday-Saturday-Sunday, to complete the audit allows for usual weekend activities such as doing laundry and washing dishes at family meals.

#### Action! (Explore and Explain)

**Whole Class ➔ Understanding the Process**

Ask students if they consider themselves reliable and what that means. Discuss issues of reliability in data collection, the differences between students’ situation and that of scientists, and the students’ need to collect data accurately without altering their regular patterns of personal water use.

Distribute a water usage organizer (Personal Water Audit). Orient students to the table:
- the left-hand column lists types of water use
- the type of information in each column
- how to read across rows and down columns to locate the intersection point in which to enter information

Review the method for calculating water consumption, modelling an example with a Think Aloud.

#### Consolidation (Elaborate, Evaluate, Extend)

**Whole Class/Pairs ➔ Viewing**

Model how to create a mind map of comprehension strategies. Cue students to practise strategies while viewing a video, e.g., Water Follies: A Soak Opera, a 7-minute video by Stan Phillips and Associates, 1977, which shows students how not to conserve water.

In pairs, students capture what they heard/saw in a mind map, each making a personal copy. Discuss how a video communicates information, how techniques emphasize and make messages memorable, how various representations of information reinforce learning. (This is relevant to later lessons.) Return portfolios. Students label, date, and insert their mind map in their Why do I care? Water Portfolio.

#### Homework and Next Lesson Connection

Students complete the water audit.

On the following Monday, engage students in a shared data analysis, e.g., look for usage patterns across students and for anomalies. Discuss the implications of these, e.g., What water usage is most frequent? What are some ways in which each of us can reduce the amount of water that we use? List suggestions on chart paper.

---

**Pause and Ponder**

**Quick Tip** Brainstorming is an intense problem-solving strategy that rapidly generates ideas without editing or evaluating them.

**AOL** Provide oral feedback on students' ideas for verifying the accuracy of the estimate.

**Quick Tip** Add key vocabulary to the Word Wall throughout the unit. Use words regularly.

**Quick Tip** Document Use: The Personal Water Audit is an example of an intersected list. Support learning about reading text types by using the Strategy Implementation Continuum.

**Quick Tip** A RAFTS graphic organizer could be used to structure discussion of video.

**Quick Tip** To ensure full participation in the shared data analysis, provide students who have not completed their personal water audit with a simplified version, created as a sample.
Minds On

Share One-Get One
Prepare cards with terms on one side and informal explanations on the other. Each student draws one card. On a signal, students mingle and on a second signal, meet a partner. One student asks the other the term; the partner responds. The first student either confirms or provides the answer. Partners reverse roles and exchange cards. Repeat.
The Share One-Get One strategy is a low-risk activity that can be used to review terminology and energize students in 3-4 minutes.

Model
Modelling is a component of explicit instruction that is particularly helpful for struggling learners. According to the gradual release of responsibility model for instruction, modeling is done by the teacher and students observe (I do, you watch). This is followed by shared practice (I do, you help) and guided practice (you do, peers help), and finally independent practice (you do, I help if necessary). See the Strategy Implementation Continuum for a detailed chart of this framework.

Think-Aloud
Think-Aloud is an instructional scaffold that models thinking processes, making the invisible visible. In a Think-Aloud, the teacher verbalizes how effective readers process the text, e.g., by monitoring comprehension and using strategies to construct meaning. While teachers can think aloud at any point in an instructional sequence, Think-Alouds are frequent during the modeling phase of the gradual release model and during Read-Alouds.
See Think Literacy Subject-Specific Examples: Language/English, Grades 7-9, Engaging in Reading: Reading Between the Lines/Inference, page 3.
Think-Aloud is a form of explicit instruction that requires teachers to be aware of their own thinking processes and that helps student think about their thinking. Developing metacognitive awareness is an important aspect of learning.
See Metacognition Guide.

Action!

Intersected Lists
Document Use*: The Personal Water Audit is an example of an intersected list. These kinds of tables are common in daily life, e.g., for bus schedules or invoices, because they efficiently summarize a lot of information. Lists of various kinds are frequently used in science.
A simple list groups related items under a label. These lists may be verbal or graphic; horizontal, vertical or spatially arranged; organized or random. An example of a simple list would be a list of materials for a lab or a list of instructions.
A combined list places two or more simple lists side-by-side so that corresponding items are side-by-side. An example of a combined list would be a list of states of water with corresponding explanations and percentage.
An intersected list is a matrix or a table, which arranges labels along two dimensions, e.g., across the top and down the left-hand side. Intersected lists are an efficient way of summarizing information in three simple lists. To locate information in an intersected list, students locate the appropriate labels and follow the column and row to where they intersect. Examples of intersected lists are schedules or maps.
*Locating information in and interpreting tables, and entering information into tables is referred to as “Document Use.” Document use is one of the 9 Essential Skills of Human Resources and Skills Development Canada.
See Essential Skills and Essential Skills Profiles.

For information on lists, see the following:

Strategy Implementation Continuum
This instructional sequence is based on the gradual release of responsibility model. Modelling and think-alouds which make thinking process visible to students is a form of explicit instruction, in which students observe and teachers demonstrate. Think alouds require teachers to be aware of their own thinking processes. Move from there to guided practice, in which the teacher guides students through the process. Students help the teacher instead of watching. See Strategy Implementation Continuum.
Consolidation

Mind Map
Bennett and Rolheiser (2001) identify critical attributes of mind maps:
- a central image representing the subject
- main themes radiating like branches from that central image
- a key image or key word for each branch
- connections between the image and branches
- use of colour

Comprehension Strategies
Strategies include: reading with a purpose, previewing, making and adjusting predictions, and using a graphic organizer to hold thinking.
For reading comprehension strategies, see Think Literacy Cross-Curricular Approaches, Grades 7-12, pages 7-95. Many of these are applicable to viewing and listening.
For listening strategies, see the Listening Guide.

Anchor Charts
An anchor chart is a strategy for capturing students’ voices and thinking. Anchor charts are co-constructed. By making students’ thinking visible and public, they “anchor,” or stabilize and scaffold classroom learning. Anchor charts should be developmentally appropriate and clearly focused, accessible, and organized.
**RAFT**

**RAFT** (Role, Audience, Format, Topic) or **RAFTS** (Role, Audience, Format, Topic, Strong Verb) is a graphic organizer used for planning. Students use this tool to explore the role they will take on as creators, the audience they will address, the varied formats for their product, and the topic.

A RAFT establishes a context for writing by focusing on the dynamic connections between author, audience, topic, form, and purpose that are at the heart of communication. As with other graphic organizers, RAFT provides a framework to consider the various components (i.e., Role, Audience, Format, and Topic) as well as the relationships between them. RAFT can be used as a planning tool for media, written, and oral communication.

See **Student Success DI Package 2007, DI Cue Cards: Structures – RAFTs**

See **Think Literacy Subject-Specific Examples, Language/English, Grades 7-9, Generating Ideas: Setting the Context**, pp. 32-37.
