Continuum and Connections
Proportional Reasoning
Overview

Context Connections
- Positions proportional reasoning in a larger context and shows connections to everyday situations, careers, and tasks
- Identifies relevant manipulatives, technology, and web-based resources for addressing the mathematical theme

Connections Across the Grades
- Outlines the scope and sequence using Grade 6, Grade 7, Grade 8, Grade 9 Applied and Academic, and Grade 10 Applied as organizers
- Includes relevant specific expectations for each grade
- Summarizes prior and future learning

Instruction Connections
- Suggests instructional strategies, with examples, for each of Grade 7, Grade 8, Grade 9 Applied, and Grade 10 Applied
- Includes advice on how to help students develop understanding

Connections Across Strands
- Provides a sampling of connections that can be made across strands, using the theme (proportional reasoning) as an organizer

Developing Proficiency
- Provides questions related to specific expectations for a specific grade/course
- Focuses on specific knowledge, understandings, and skills, as well as on the mathematical processes of Reasoning and Proving, Reflecting, Selecting Tools and Computational Strategies, and Connecting. Communicating is part of each question.
- Presents short-answer questions that are procedural in nature, or identifies the question as problem solving, involving other mathematical processes, as indicated
- Serves as a model for developing other questions relevant to the learning expected for the grade/course

Problem Solving Across the Grades
- Presents rich problems to help students develop depth of understanding. Problems may require a body of knowledge not directly related to a specific expectation.
- Models a variety of representations and strategies that students may use to solve the problem and that teachers should validate
- Focuses on problem-solving strategies, involving multiple mathematical processes
- Provides an opportunity for students to engage with the problem at many levels
- Provides problems appropriate for students in Grades 7–10. The solutions illustrate that the strategies and knowledge students use may change as they mature and learn more content.

Is This Always True?
- Presents rich problems to help students develop depth of understanding. Problems may require a body of knowledge not directly related to a specific expectation.
- Focuses on the mathematical process Reasoning and Proving, and Reflecting
Proportional Reasoning

Context

- Proportional reasoning has been referred to as the capstone of the elementary curriculum and cornerstone of algebra and beyond. (Lesh, Post, & Behr, 1987)
- Students use ratios to describe proportional relationships involving number, geometry, measurement, and probability.
- Students understand and use ratios and proportions to represent quantitative relationships. (NCTM Standards)
- Students develop, analyse, and explain methods for solving problems involving proportions such as scaling, and finding equivalent ratios and rates.
- Proportional reasoning is the ability to think about and compare multiplicative relationships between quantities.

Context Connections

Recipes Sharing Measurement/Monetary Conversions Comparison Shopping

Data Graphs Ratios Fluid Concentrations Similarity

Scale Drawing Probability Percents/Fractions Other Connections

Manipulatives
- coloured tiles
- cubes/geoboards
- fraction circles/rings/rods
- grid paper
- pattern blocks

Technology
- The Geometer’s Sketchpad®
- Fathom®
- calculators/graphing calculators
- spreadsheet software
- virtual manipulatives

Summary of Prior Learning

**In earlier years, students:**
- build an understanding of simple multiplicative relationships involving whole-number rates, through investigation, using concrete materials and drawings;
- determine and explain the relationship between fractions and their equivalent decimal and percentage amounts, using concrete materials;
- use multiplication and division of whole numbers to solve problems including situations involving equivalent ratios and rates;
- represent ratios;
- demonstrate an understanding of relationships involving percent, ratio, and unit rate;
- solve problems requiring conversion from larger to smaller metric units.

**In Grade 7, students:**
- continue to determine the relationship between fractions, decimals, and percent;
- develop an understanding of rates as a comparison of two measures with different units;
- solve problems involving whole number percents and unit rates using a variety of tools and strategies;
- determine conversions of metric units of measure;
- demonstrate an understanding of proportional relationships using percent, ratio, and rate.

**In Grade 8, students:**
- continue to solve problems that involve percent and rates;
- identify and solve problems involving proportions, using concrete materials;
- solve problems using proportional reasoning in meaningful contexts;
- identify and describe real-life situations involving quantities that are directly proportional.

**In Grade 9 Applied, students:**
- solve for an unknown in a proportional relationship by using a variety of methods including algebraic methods;
- solve problems that require a fraction, decimal, or percent to be rewritten in an equivalent form;
- make comparisons using unit rates;
- represent and solve problems involving ratios, rates, and directly proportional relationships in context.

**In Grade 10 Applied, students:**
- use their knowledge of ratios and proportions to investigate and use the property of similar triangles that the ratios of corresponding sides are equal;
- solve problems involving similar triangles in realistic situations.

**In later years**
Students’ choice of courses will determine the degree to which they apply their understanding of concepts related to proportional reasoning.
### Instruction Connections

<th>Helping To Develop Understanding</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Grade 7</strong></td>
<td></td>
</tr>
<tr>
<td>• Investigate and represent the relationships among fractions, decimals, and percents, using concrete materials.</td>
<td>• When examining two ratios, it is sometimes useful to think of them as being either within ratios or between ratios. A ratio of two measures in the same setting is a within ratio. A between ratio is a ratio of two corresponding measures in different situations. (John Van de Walle) Provide opportunities for students to think about ratios in these two ways.</td>
</tr>
<tr>
<td>• Connect students’ knowledge about percents to make comparisons in context.</td>
<td>• A ratio can compare a part to a whole (part-to-whole) or a part of the whole to another part of the whole (part-to-part). Provide opportunities for students to develop their understanding by setting activities in a wide range of contexts.</td>
</tr>
<tr>
<td>• Express probabilities as ratios.</td>
<td>• Demonstrate that ratios can also compare measures of two different types. (rates)</td>
</tr>
<tr>
<td>• Apply both experimental and theoretical probabilities to make predictions.</td>
<td>• Relate proportional reasoning to existing processes, for instance the concept of unit fractions is similar to unit rates.</td>
</tr>
<tr>
<td>• Investigate dilatations, using a variety of tools, e.g., pattern blocks, overhead transparencies, computer technology.</td>
<td>• Delay the use of rules and algorithms for solving proportions, until students have developed proportional reasoning skills.</td>
</tr>
<tr>
<td>• Create similar triangles on the Cartesian plane using grid paper, measure and compare angles, longest, shortest, and remaining sides.</td>
<td>• Encourage discussion and experimentation in comparing ratios.</td>
</tr>
<tr>
<td>• Enlarge/reduce similar triangles to build understanding of the proportionality of similar triangles, using The Geometer’s Sketchpad®4.</td>
<td>• Vary the numerical relationships or the context in which the problems are posed.</td>
</tr>
<tr>
<td>• Model rates by graphing to visualize the relationship, and by creating algebraic expressions.</td>
<td>• Pose problems for students to explore that help them to identify multiplicative situations.</td>
</tr>
<tr>
<td>• Illustrate ratios, using scale drawings.</td>
<td>• Fraction, ratio, and rational number ideas are mathematically complex and interconnected. Provide students with time to construct important ideas and ways of thinking. (Lamon)</td>
</tr>
<tr>
<td>• Model situations requiring the determination of best rates, using geoboards.</td>
<td>• Give students multiple opportunities to progress through different representations – concrete → diagrams/tables → symbolic.</td>
</tr>
<tr>
<td><strong>Grade 8</strong></td>
<td></td>
</tr>
<tr>
<td>• Investigate the relationship between the circumference and the diameter of a circle as a ratio to determine π.</td>
<td>• Have students write word statements to describe their reasoning.</td>
</tr>
<tr>
<td>• Solve percent problems arising from everyday familiar contexts in more than one way.</td>
<td>• Have students represent proportion problems as unit rates.</td>
</tr>
<tr>
<td>• Solve problems involving proportions, using concrete materials and drawings.</td>
<td>• Use numerical comparison problems where two complete rates are given and students are asked to answer questions about how the rates are to be compared.</td>
</tr>
<tr>
<td>• Develop an understanding that proportions are multiplicative relationships.</td>
<td>• Present problems that involve qualitative prediction and comparison that require responses not dependent on specific numerical values.</td>
</tr>
<tr>
<td>• Represent probabilities in multiple ways, e.g., fractions, percents, ratios.</td>
<td>• Research suggests teaching multiple strategies, starting with unit rate and factor of change which are more intuitive then followed by fractions and the cross product algorithm.</td>
</tr>
<tr>
<td>• Investigate similar figures using concrete materials and The Geometer’s Sketchpad®4.</td>
<td>• Delay the use of rules and algorithms for solving proportions, until students have developed proportional reasoning skills.</td>
</tr>
<tr>
<td>• Investigate proportional relationships among measurable attributes of geometric figures.</td>
<td>• Encourage discussion and experimentation in comparing ratios.</td>
</tr>
<tr>
<td><strong>Grade 9 Applied</strong></td>

**(Connecting and Reflecting)**

Pose a problem that could be solved using the given diagram of similar triangles.

*Show your work and explain your reasoning.*
A local recreation centre is building a new outdoor pool to accommodate the growing population. The old pool contained 120,000 gallons of water, and required 50 pucks of chlorine per week. The new pool will contain 500,000 gallons of water. How many pucks of chlorine will be required to chlorinate the new pool for a week?

1. 
2. 
Although the teacher may expect a student to apply specific mathematical knowledge in a problem-solving context, the student may find some unexpected way to solve the problem.

Have available a variety of tools from which students can choose to assist them with their thinking and communication.

1.  
   120 000 gallons of water ÷ 50 pucks = 2400 gallons of water for 1 puck  
   500 000 gallons of water ÷ 2400 gallons/puck = 208.33 pucks  
   It could take 208 or 209 pucks.

2.  
<table>
<thead>
<tr>
<th>Number of Gallons of Water</th>
<th>Number of Pucks</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>120 000</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>240 000</td>
<td>100</td>
<td>double</td>
</tr>
<tr>
<td>480 000</td>
<td>200</td>
<td>double again</td>
</tr>
<tr>
<td>2400</td>
<td>1</td>
<td>$\frac{240 000}{100}$</td>
</tr>
<tr>
<td>24 000</td>
<td>10</td>
<td>$2400 \times 10$</td>
</tr>
<tr>
<td>4800</td>
<td>2</td>
<td>$2400 \times 2$</td>
</tr>
</tbody>
</table>

   Estimate:
   
   $500 000 \div 480 000 + 24 000 = 4800$
   
   or $\approx 499200$
   
   $500 000 \div 480 000 + 24 000 \approx 501 600$

   Therefore, the number of pucks needed is between 200 $+ 10 - 2$ and $200 + 10 - 1$.  
   So, the number of pucks needed is between 208 and 209.  
   (Round up to 209 pucks for safety.)
Grade 8

Sample Solutions

Students’ solutions could include any of the Grade 7 answers.

1. | Gallons of Water | Pucks |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>120 000</td>
<td>50</td>
</tr>
<tr>
<td>240 000</td>
<td>100</td>
</tr>
<tr>
<td>360 000</td>
<td>150</td>
</tr>
<tr>
<td>480 000</td>
<td>200</td>
</tr>
<tr>
<td>600 000</td>
<td>250</td>
</tr>
</tbody>
</table>

500 000 gallons of water is between 480 000 gallons and 600 000 gallons. Therefore, between 200 and 250 pucks would be needed.

2. a) “Between” ratios

120 000 is proportional to 500 000. The scale factor is 500 000 ÷ 120 000 = \( \frac{50}{12} \)

\[
50 \times 4 \frac{1}{6} = 200 \div \frac{50}{6} = 208 \frac{1}{3} = 4 \frac{1}{6} \approx 4.166667
\]

b) “Within” ratios

\[
\frac{5}{12 000} = \frac{x}{500 000}
\]

12 000x = 5(500 000)

\[
x = \frac{2500}{12} \approx 208.33
\]

They would use 209 pucks.
Students’ solutions could include any of the Grades 7 and 8 answers.

1. \[ \frac{\text{chlorine pucks in the old pool}}{\text{gallons of water in the old pool}} = \frac{\text{chlorine pucks in the new pool}}{\text{gallons of water in the new pool}} \]

\[ \frac{50 \text{ pucks}}{120 000 \text{ gallons}} = \frac{x}{500 000 \text{ gallons}} \]

First multiply both sides by 500 000 gallons.

\[ (500 000 \text{ gallons}) \frac{50 \text{ pucks}}{120 000 \text{ gallons}} = (500 000 \text{ gallons})(x) \]

Use a calculator to compute the left-hand side of the equation.

\[ 208.333333 \text{ pucks} = x \]

It would take 209 pucks to keep the pool chlorinated.

2. \[ m = \frac{240 000 - 120 000}{100 - 50} \]

\[ = \frac{1200}{5} \]

\[ y = 2400x \]

\[ 2400x = 500 000 \]

\[ x = \frac{500 000}{2400} \]

\[ = 208.3 \]

It will take 209 pucks.

3. It will take about 209 pucks.
A trip is being planned from Kingston to Toronto. By car it is a 200 km drive and by train the route is 250 km. If the car averages 90 km/h and the train averages 120 km/h, which means of travelling is faster? Show at least two solutions.

1. 
2. 
Although the teacher may expect a student to apply specific mathematical knowledge in a problem-solving context, the student may find some unexpected way to solve the problem.

Have available a variety of tools from which students can choose to assist them with their thinking and communication.

</tr>
</tbody>
</table>

Students note that after 2 hours the car has 20 km to go, and the train only has 10 km to go. Since the train is going faster and has less distance left after 2 hours, it would get there first.

2.

The car:

Students see what 90 is multiplied by to get to 200.

\[
\frac{90 \text{ km}}{1 \text{ hour}} = \frac{200 \text{ km}}{x}
\]

(200 divided by 90 = 2.22)

They then multiply the denominator by the same factor to get the equivalent ratio. 

\[(1 \times 2.22)\]

So, the car takes 2.22 hours

The train:

Students see what 120 is multiplied by to get to 250.

\[
\frac{120 \text{ km}}{1 \text{ hour}} = \frac{250 \text{ km}}{x}
\]

(250 divided by 120 = 2.08)

They then multiply the denominator by the same factor. 

\[(1 \times 2.08) = 2.08\]

So, the train takes 2.08 hours
3. **Car**
- 90 km/hour
- 90 km/60 minutes
- 15 km/10 minutes

**Train**
- 120 km/hour
- 120 km/60 minutes
- 20 km/10 minutes

<table>

<td>260</td>
</tr>
</tbody>
</table>

The train travelled 250 km between 120 minutes and 130 minutes.

Therefore, the train took less time and arrived first.

**Grade 8**

Students’ solutions could include any of the Grade 7 answers.

<table>
<thead>
<tr>
<th>Car</th>
<th>Train</th>
</tr>
</thead>
<tbody>
<tr>
<td>90 km/hour</td>
<td>120 km/hour</td>
</tr>
<tr>
<td>90 km/60 minutes</td>
<td>120 km/60 minutes</td>
</tr>
<tr>
<td>15 km/10 minutes</td>
<td>20 km/10 minutes</td>
</tr>
</tbody>
</table>

For the car, to get from 90 down to 1, divide by 90. On the right hand side 200 divided by 90 equals 2.22 hours to complete the journey by car. For the train to get from 120 down to 1, divide by 120. On the right hand side also divide by 120. The train takes 250 divided by 120 or approximately 2.08 hours.
Students’ solutions could include any of the Grades 7 and 8 answers.

**a) Car Travelling Time** (using “between” ratios)

\[
\frac{\text{car distance}}{\text{car time}} = \frac{\text{total distance}}{\text{total time}}
\]

\[
\frac{90 \text{ km}}{1 \text{ hour}} = \frac{200 \text{ km}}{x}
\]

Solve by first multiplying both sides by \(x\).

\[
(x) \frac{90 \text{ km}}{1 \text{ hour}} = \frac{200 \text{ km}}{x} (x)
\]

\[
(x) 90 \text{ km/hour} = 200 \text{ km}
\]

Divide both sides by 90 km/hour.

\[
\frac{(x) 90 \text{ km/hour}}{90 \text{ km/hour}} = \frac{200 \text{ km}}{x 90 \text{ km/hour}}
\]

\[
x = 2.22 \text{ hours}
\]

**Train Travelling Time**

\[
\frac{\text{train distance}}{\text{train time}} = \frac{\text{total distance}}{\text{total time}}
\]

\[
\frac{120 \text{ km}}{1 \text{ hour}} = \frac{250 \text{ km}}{x}
\]

Solve by first multiplying both sides by \(x\).

\[
(x) \frac{120 \text{ km}}{1 \text{ hour}} = \frac{250 \text{ km}}{x} (x)
\]

\[
(x) 120 \text{ km/hour} = 250 \text{ km}
\]

Divide both sides by 120 km/hour.

\[
\frac{(x) 120 \text{ km/hour}}{120 \text{ km/hour}} = \frac{250 \text{ km}}{x 120 \text{ km/hour}}
\]

\[
x = 2.08 \text{ hours}
\]

**b) As well, the proportion could have been set up using “within” ratios.**
Students’ solutions could include any of the Grades 7, 8, and 9 answers.

a) Using the graph, students read the appropriate points and compare them to demonstrate that the train arrives first.

b) Problem-Solving Strategies:
- Use equations and graphs
- Use a table of values
- Use substitution

<table>
<thead>
<tr>
<th>( x ) (Time in Hours)</th>
<th>( Y_1 ) (Car Distance)</th>
<th>( Y_2 ) (Train Distance)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>90</td>
<td>120</td>
</tr>
<tr>
<td>2</td>
<td>180</td>
<td>240</td>
</tr>
<tr>
<td>3</td>
<td>270</td>
<td>360</td>
</tr>
</tbody>
</table>

After 2 hours the car still has 20 km to travel, while the train has 10 km to travel (and is travelling faster than the car). Therefore, the train will arrive first.

c) 

\[
\begin{align*}
200 &= 90x \\
\frac{200}{90} &= x \\
2.22 &= x \\
250 &= 120x \\
\frac{250}{120} &= x \\
2.08 &= x
\end{align*}
\]
A community is planning to build a new library. The library is being built next to the community pool with 72 metres between them. The builders want to make sure that the library building does not put a shadow over the pool. At the time of the maximum shadow, a flag pole that is 3 metres high gives an 8 metre shadow. What is the maximum height for the library building?

Verify your solution using a different strategy.

1. 

2. 
Although the teacher may expect a student to apply specific mathematical knowledge in a problem-solving context, the student may find some unexpected way to solve the problem.

Have available a variety of tools from which students can choose to assist them with their thinking and communication.

1. Students build an “L” shape which is 8 by 3 units, using the edge of the cubes to represent the flagpole and its shadow.

![Flagpole and shadow diagram]

They use one cube to represent one metre. They could use a scale, e.g., 1 cube represents 9 metres, or 1 cube represents 3 metres. Students multiply the horizontal cubes and vertical cubes by the same factor to keep the proportion the same.

This would result in something like this:

![Cube representation diagram]

1 cube = 9 m

If each cube represents 9 m, then the maximum height of the library would be: 3 cubes × 9 m = 27 m

2. 

![Cube representation diagram]

1 cube = 3 m

If each cube represents 3 m, then the maximum height of the library would be: 9 cubes × 3 m = 27 m

**Note:** Students are focussed on the edge of the cubes.
Grade 7

3. a) \[
\frac{\text{height}}{\text{shadow}} = \frac{3 \text{ m}}{8 \text{ m}} = \frac{x}{72}
\]

They would examine the denominators and determine what factor 8 was multiplied by to get 72. \((72 \div 8 = 9)\) They multiply the numerator by the same factor. \((3 \times 9 = 27 \text{ metres})\)

b) \[
\frac{\text{height}}{\text{height}} = \frac{3 \text{ m}}{x \text{ m}} = \frac{8}{12} = \frac{1}{9}
\]

since \(\frac{3}{27} = \frac{1}{9}\)

Therefore, maximum height is 27 metres.

Grade 8

Students’ solutions could include any of the Grade 7 answers.

1. \[
\frac{\text{height}}{\text{shadow}} = \frac{3 \text{ m}}{8 \text{ m}} = \frac{x}{72}
\]

a) Students look at the known proportion. They look at what factor 3 was multiplied by to get 8. \((8 \div 3 = (\text{approximately}) \ 2.66667)\) They divide 72 by the same factor. \((72 \div 2.66667 = 27 \text{ metres})\)

b) Students could use the proportion \(\frac{3}{8}\).

\[
\frac{3}{8} \text{ of } 72 = 27 \text{ metres}
\]
Grade 8

Sample Solutions

Students’ solutions could include any of the Grade 7 answers.

2. Students graph 8 across and 3 up (8, 3) and then continue to plot points that translate [+8, +3]. This would lead them to (72, 27). When the horizontal distance is 72 m, the height is at 27 m.

3.

<table>
<thead>
<tr>
<th>Height of Building (m)</th>
<th>Length of Shadow (m)</th>
<th>Reason</th>

<td>64</td>
<td>double</td>
</tr>
<tr>
<td>27</td>
<td>72</td>
<td>add original</td>
</tr>
</tbody>
</table>

Problem-Solving Strategies:
- Use a ratio table
Students’ solutions could include any of the Grade 7 and 8 answers.

a) “Within” ratios

\[
\frac{\text{pole height}}{\text{pole shadow}} = \frac{\text{building height}}{\text{building shadow}}
\]

\[
\frac{3}{8} = \frac{x}{27}
\]

Multiply both sides by 72.

\[
(72)\left(\frac{3}{8}\right) = x\left(\frac{72}{72}\right)
\]

\[
27 = x
\]

The building can be 27 metres tall.

b) “Between” ratios

\[
\frac{\text{pole height}}{\text{building height}} = \frac{\text{pole shadow}}{\text{building shadow}}
\]

\[
\frac{3}{x} = \frac{8}{72}
\]

\[
8x = (3)(72)
\]

\[
x = (3)(72) \div 8
\]

\[
x = 27
\]

The building can be 27 metres tall.
Students’ solutions could include any of the Grades 7, 8, and 9 answers.

1. Connect the angle to known information.

\[ \tan \theta = \frac{3}{8} \]

\[ \theta = 20.55604522 \text{ degrees} \]

Similarly with the building,

\[ \tan 20.55604522 = \frac{x}{72} \]

\[ x = 72 \tan (20.55604522) \]

\[ x = 27 \text{ m} \]

The building can be no more than 27 metres tall.

2. a) “Within” ratios

\[ \frac{x}{72} = \frac{3}{8} \]

\[ x = \frac{3}{8} (72) \]

\[ x = 27 \]

b) “Between” ratios

\[ \frac{x}{3} = \frac{72}{8} \]

\[ x = \frac{72}{8} (3) \]

\[ x = 27 \]

Therefore, the building should have a maximum height of 27 metres.
Is it always true that if two rectangles are similar their diagonals will match up when they are stacked one on top of the other. See the diagram.

Grade 7

Yes. I cut several rectangles from graph paper that are similar, glued them on top of each other and used a ruler to show that their diagonals line up.

Sample Solutions

Problem-Solving Strategies:
- Make paper models
- Use logical reasoning

Grade 8

Yes. I cut several similar triangles starting with similar rectangles and cutting along the diagonal. Using the reasoning that the angles in the similar triangle are the same and the sides are proportional, the diagonals show that the hypotenuse of triangles extend along one line. Since the hypotenuse is the diagonal, the property is true.

Problem-Solving Strategies:
- Use similar triangles
Grade 9

Yes. I measured the sides of the rectangle to find the slope of the diagonal in each case. Since the slopes are all the same, the property is always true.

Problem-Solving Strategies:
• Create similar rectangles on graph paper
• Compare slopes

Grade 10

Yes. I constructed similar rectangles and used trigonometry to find the angle between the length and the diagonal of each triangle within the rectangles. Since the angle will be the same in each similar rectangle, the property is true.

Problem-Solving Strategies:
• Use trigonometry
Sarah claims that when two triangles have one angle the same size then the triangles have proportional sides?

**Grades 7–10**

**Sample Solutions**

No. Use graph paper, a protractor, and a ruler to draw several triangles that have one angle the same but the sides are not proportional. Construct an example, using geoboards or The Geometer’s Sketchpad®.

\[ \frac{AB}{EF} = \frac{6}{6} = 1 \]
\[ \frac{BC}{FD} = \frac{6}{5} \text{ (not } 1:1) \]

The ratio of side AB to side EF is 6:6 = 1.1
The ratio of side BC to side FD = 6:5 (not 1:1)

**Grades 8–10**

No. All three sides of two triangles are proportional only if they are similar triangles. The condition for similar triangles is that all three angles of one triangle would be the same as the three angles in the other triangle.
Is This Always True?  

Grades 7–10

Is it always true that the circumference of a circle divided by the radius will always give the same answer?

**Sample Solutions**

Yes.

a) Students could choose some examples of circles of different sizes, and measure their circumferences and radii. They divide the radius and verify that it is the same.

b) Students could construct several circles, using a compass. They measure the perimeter and the diameter with a piece of string, and use a calculator to divide the circumference by the radius for each example to show that the answer is the same for each case.

<table>
<thead>
<tr>
<th>Radius $(r)$</th>
<th>Circumference $(c)$</th>
<th>$\frac{c}{r}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>$10\pi$</td>
<td>$\frac{10\pi}{5} = 2\pi$</td>
</tr>
<tr>
<td>20</td>
<td>$40\pi$</td>
<td>$\frac{40\pi}{20} = 2\pi$</td>
</tr>
</tbody>
</table>

The answer will always be $2\pi$.

c) Students could use GSP®4 to create a circle, and measure the radii and circumference of each circle. They calculate the ratio circumference divided by the radii and tabulate or drag to calculate a large number of examples.

d) Students could use the formula.

\[
\frac{2\pi r}{r} = 2\pi
\]
